 Diego, La Jolla, California 92093, U.S.A.

CONTENTS

I.	Introduction	254
II.	The colloidal universe	254
	A. Occurrence of dust in cosmos	254
	B. Structural properties of cosmic condensates	256
	C. Possible locales of cosmic condensation	258
III.	The cosmic nucleation environment	259
	A. Composition of the vapor phase	259
	B. Physical state of cosmic nucleation environment	259
	C. Dense interstellar clouds	262
IV.	Thermal physics of colloidal plasmas in space	263
	A. Clusters	264
	B. Definition of various temperatures	264
	C. Plasma-cluster medium in thermodynamic disequilibrium	265
	D. The intensity of the radiation field	266
	E. Temperature of bulk condensed phase	268
	F. The state of temperature disequilibrium	270
V.	Nucleation and growth	271
	A. Applicability of classical nucleation theory to cosmic conden- sation	271
	B. Ion-molecule reactions in space	272
	C. "Supersaturation" and "nucleation"	274
	D. Growth	275
	E. Condensation onto bulk condensed phase	278
	F. Crystalline ordering at cluster and grain growth	278
VI.	Concluding remarks	280
